Northstar Desk security overview

This overview describes how Northstar Desk protects customer data. It is written for security reviewers and applies to every plan.

Encryption. Customer data is encrypted at rest with AES-256. All traffic to Northstar Desk uses TLS 1.2 or higher. Plain HTTP connections are redirected or refused.

Backups. Each region is backed up daily. Backups are encrypted, kept for 35 days, and stored in a second availability zone inside the same region. Our recovery point objective is 24 hours and our recovery time objective is 8 hours.

Testing. An independent firm runs a penetration test of the product once a year. Findings rated high or critical are fixed within 30 days.

Compliance reports. Northstar Desk holds a SOC 2 Type II report. Team and Enterprise customers can request it under a non-disclosure agreement from the Compliance section of the security settings.

Staff access. Northstar employees can open a customer workspace only after an Admin of that workspace grants support access. A support access grant expires automatically after 72 hours, and every access is recorded.

Reporting a vulnerability. Send security reports to security@northstardesk.example. We acknowledge every report within 3 business days and keep the reporter informed until the issue is fixed.
